

HubSpot Integration Reliability

by Amanda Bridge

The image features the HubSpot logo prominently in the center. The logo consists of the word "HubSpot" in a dark blue, sans-serif font, with the letter "o" replaced by an orange icon of a network node. The background is a blurred photograph of two women in an office environment. One woman, with dark hair, is seated and looking at a tablet. The other woman, with curly red hair, is standing and smiling while holding a white mug. The overall scene is brightly lit and has a soft, professional feel.

HubSpot

BACKGROUND

I and an engineering lead led an initiative to improve our front end responses when a 3rd party outage affected the uptime of one of our strategic integrations.

BACKGROUND

80% of pro accounts and **60% of free accounts** have more than 10 integrations installed, and so a lot of our user questions include references to 3rd parties when issues arise.

BACKGROUND

50% of Integration related critsits in 2023 were due to 3rd party outage and breaking changes

PRODUCT SEV_5 CLOSED

Task

TASK

Objectives

1. **Audit all API calls** of our strategic integrations, and identify the most impactful ones to our UX when a 3rd party outage or breaking change affects it.
2. **Audit current UX responses** when each of the API calls is affected.
3. Build UX and engineering **best practices** to provide responses for at least 75% of API calls.
4. **Implement changes** based on best practices.

Action

ACTION

API Audit

The screenshot shows a web application titled "API Audit" with a menu bar (File, Format, Data, Tools, Extensions, Help) and a toolbar. The main content area displays a table with the following structure:

Party APIs Audit		
3rd Party API	Details	Screenshot
[Blurred API Name]	[Blurred Details]	[Screenshot showing UK state during outage]
[Blurred API Name]	[Blurred Details]	[Blurred Screenshot]
[Blurred API Name]	[Blurred Details]	[Blurred Screenshot]
[Blurred API Name]	[Blurred Details]	[Blurred Screenshot]

At the bottom of the interface, there is a navigation bar with the following items: **Routing**, **Collaboration**, **CRM**, **ECommerce**, **ERP**, **Video Conferencing**, **Other**, **Statistics**, and **Play progress**.

Market research

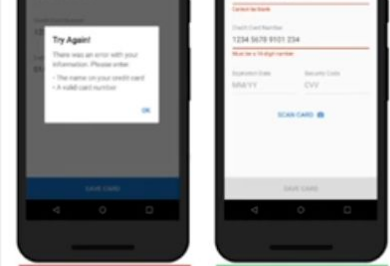

5. Have a Communication Plan Ready

When stuff hits the fan, make sure you've got a plan in place so that you can quickly communicate with your team about what needs to get done. You're also going to need a plan for communicating with your customers and the public.

Internal Communication

Interwined or not, it's still vital that we're efficient communicators.

- X Form entry is not validated until after submission and the error message provided is out of context without actionable recommendations.
- ✓ Actionable error messages are provided in context, in real time, upon data entry.

Image credit: Google

ACTION

Build foundational best practices

Nielsen Norman Group Error Best Practices:

- Design effective error messages by ensuring they are highly **visible**, provide **constructive communication**, and **respect** user effort.

HubSpot Error Message Guidelines:

Don't

- Don't use technical or HubSpot jargon.
- Don't use frivolous language like 'oops', 'uh-oh' and 'it's us, not you'.
- Don't use exclamation marks.
- Don't say sorry or take up space with too many pleasantries.

Do

- Be clear, direct, brief, and helpful.

ACTION

Build foundational best practices

Differences between errors related to 3rd party outages and general errors:

- We **don't control the solution** or its timeline
- Instead of something simply not working, **data may be outdated and incorrect**
- In some cases, **users might not notice something went wrong** without an error
- **Errors are never in response to an incorrect user input** (i.e. even if the user did everything right, the error would still happen)
- Sometimes, these **errors are temporary and will be fixed without any action** from the user.

ACTION

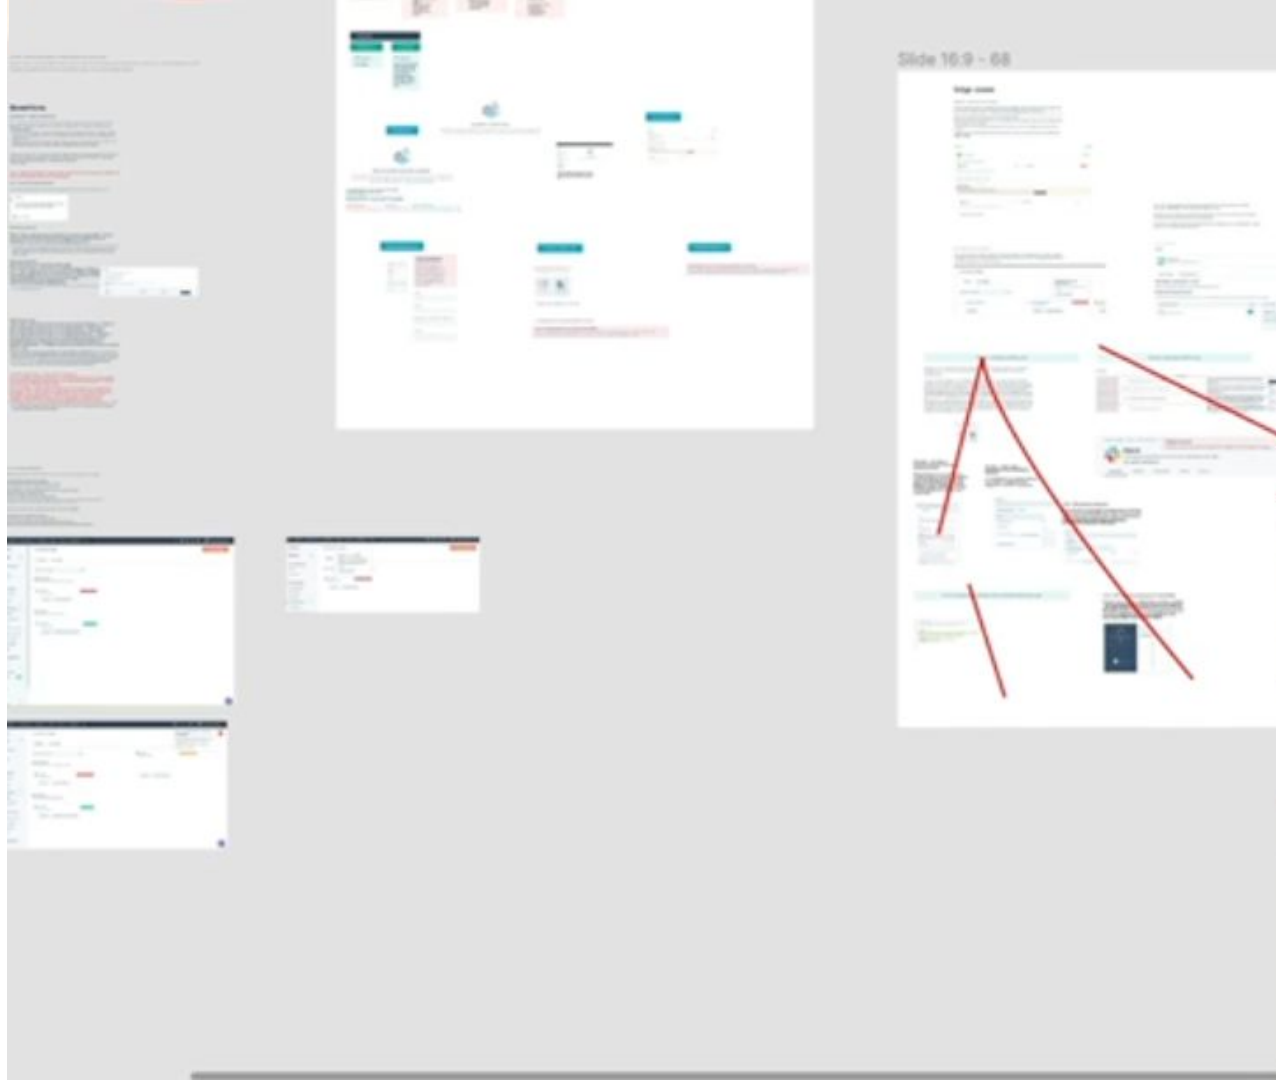

Build foundational best practices

HubSpot best practices for errors relating to third-party outages:

- **Be contextual.** Show the error where the user is working.
- **Be timely.** When possible, warn the user *before* they attempt an action that is temporarily affected by an outage.
- **Take the blame.** Do not blame the 3rd party application, and do not reference the outage in case they haven't publicized it yet. Never blame the user.
- **Be human.** Tell people what happened in the most human way possible. Do not show the user a coded error message.
- **Be actionable.** Although there is often no action needed from the user to resolve the error, always provide the user with a next step.

UX best practices

User experience best practices will vary depending on the characteristics of your scenario. Follow the questionnaire below to find your best practices.

Which characteristic best describes how the error was initiated?

User is in HubSpot

A user clicks an element or performs an action that is unable to go through because of an outage

A user is viewing a page or information that is affected by a 3rd party outage

User is in the 3rd party app

A user is in the 3rd party app affected by the outage, and we will display an error in the app

User is not on a page related to the 3rd party app

User is not on a page related to the 3rd party app

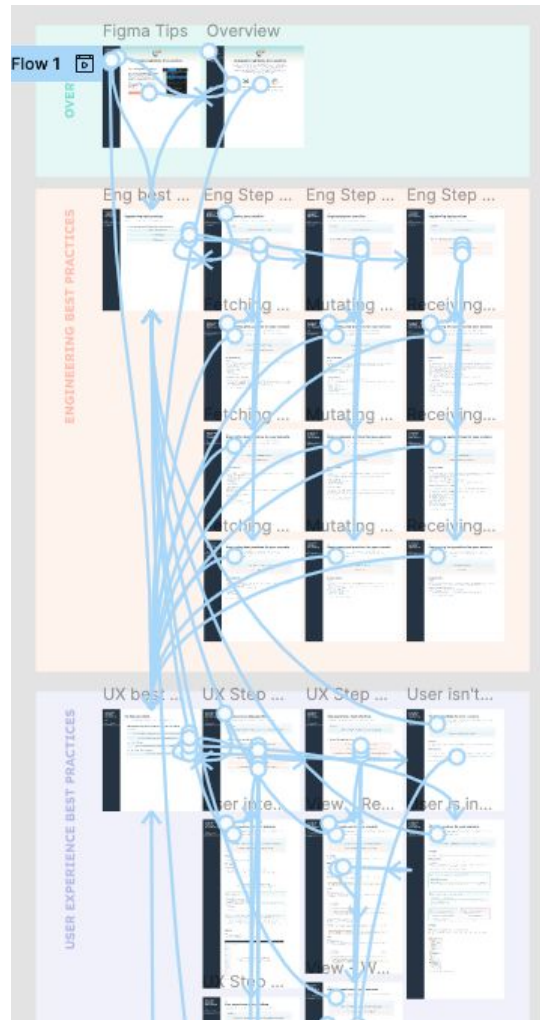

ACTION

Created best practices in Figma that solved for 86% of all API calls

Integration Reliability Best Practices

About

Engineering best practices

UX best practices

Integration reliability best practices

HubSpot's integrations allow users to connect data between HubSpot and 3rd party applications. However, when a 3rd party app has an outage or breaking change that affects HubSpot, it impacts our users' ability to perform actions and see up-to-date information.

The following best practices inform engineering and user experience design responses to common use cases we see during 3rd party outages.

Engineering best practices

Guidelines for backend engineers to help mitigate risk in the event of a 3rd party outage related to your integration.

User experience best practices

Guidelines for product designers to respond to 3rd party outages that affect our user's experience in HubSpot.

UX best practices for your scenario

The best practices outlined below will be applicable to most use cases associated with the scenario below. However, you may need to combine best practices if your error affects multiple user scenarios, or you might modify the components and content below to best fit your unique use case.

Remember to consult the [Engineering best practices](#) in tandem with these recommendations.

You selected

A user clicks an element or performs an action that is unable to go through because of an outage

The user is creating or updating a form

The user is filling out the form and an outage affects a specific field on the form

The impacted field is a required field on the form

Overview

In this scenario, the user clicked a create or edit button (or equivalent), and found that there is missing or out-of-date information in one of the fields on the page. Because the field is required, the form can't be created or edited correctly without the information.

Best practices

There are two scenarios to account for here:

1. [Information is unable to be displayed](#)
2. [Information is displayed, but could be out-of-date](#)

Best practices

There are two scenarios to account for here:

1. Information is unable to be displayed
2. Information is displayed, but could be out-of-date

Scenario 1: Information is unable to be displayed

In this scenario, the user is blocked from submitting the form because information in a required field can not be displayed at all.

Error alert

To prevent the user from getting all the way down the form or page before realizing that something isn't right, we want to inform the user as soon as possible that information is temporarily unavailable. We do this by putting an error alert at the top of the form to tell the user that what they're trying to do won't work right now.

We're having trouble connecting to [App Name] right now.

Until a connection is reestablished, we won't be able to [create/update your object]. This is due to a temporary issue with our connection, and it will most likely need no action on your part to resolve. Please try again later.

DO

- ✓ Take the blame for the outage and provide users with a helpful next step they can take in the meantime while the outage is resolved.

We're having trouble connecting to QuickBooks right now.

Until a connection is reestablished, we won't be able to create a QuickBooks invoice from HubSpot...

DON'T

- ✗ Don't blame the user or the 3rd party app. Errors happen, and the only thing we can control is our response to them.

QuickBooks is experiencing an outage.

You can't create a QuickBooks invoice from HubSpot right now...

DO

- ✓ Follow the content template below.

Summary of problem

We're having trouble connecting to [App Name] right now.

Impact to the user

Until a connection is reestablished, we won't be able to... This is due to a temporary issue with our connection, and it will most likely need no action on your part to resolve.

Explanation of solution

Next step

Please try again later.

Contextual messaging

The next thing we'll do is provide contextual messaging so the user can find where the error is occurring. Display the field as an error, and add an error message below the field.

Example

QUICKBOOKS

GET - v3/company/<realmId>/query

The user wants to create an expense in QuickBooks. Associating the expense with a payee in QuickBooks is a required field on the form, but we can't get a list of their payees to display for the user to choose from. Because this field is required, the user will not be able to submit the form to create the expense until the outage is resolved.

The screenshot shows a web form titled "Create a QuickBooks expense" with a teal header and a close button. A pink warning box at the top states: "We're having trouble connecting to QuickBooks right now. Until a connection is reestablished, you won't be able to create a QuickBooks invoice from HubSpot. This is due to a temporary issue with our connection, and it will most likely need no action on your part to resolve. Please try again later." Below this, a note says: "This action will create an expense in QuickBooks to reflect your HubSpot payment fee. [Learn more](#) about how this action works." The form contains three dropdown menus: "Which Quickbooks account do you want to create an account for?" (selected: Sandbox Company), "Payee type" (selected: Vendor), and "Payee" (selected: Select payee). A red border highlights the "Payee" dropdown. A tooltip at the bottom left of the form says: "QuickBooks expense creation is temporarily unavailable." At the bottom are "Create" and "Cancel" buttons.

Scenario 2: Information is displayed, but could be out-of-date

In this scenario, the user is able to successfully fill out the form, but information in a required field could be out of date due to the outage.

Warning alert

To prevent the user from getting all the way down the form or page before realizing that something isn't right, we want to inform the user as soon as possible that information is out-of-date. We do this by putting a warning alert at the top of the form to tell the user that what some information might be incorrect or missing.

Engineering best practices for your scenario

The best practices below are not meant to be exhaustive. Rather, they will give you a way to identify what next step is most appropriate for your users and team.

For now these are deliberately high level. In-depth technical documentation will be written once we're aligned that these recommendations and sub-categories make sense.

Remember to consult the [UX best practices](#) in tandem with these recommendations.

You selected

Related to: **Mutating 3rd party data**

There are idempotency concerns

Recommendation

General

The general recommendation for all scenarios related to mutating 3rd party data is **retrying mutations for an appropriate amount of time**. To determine how retrying your use-case should work, consider the following factors:

- Check if the mutation consists of a single operation or multiple operations. Ensure that retrying doesn't cause inconsistency issues, even if each operation is atomic.
- Evaluate whether retrying the mutation raises idempotency concerns

Here are some implementation options:

- The simplest possible solution is **built-in HTTP client retries**
- [Guava retrying library](#) or [our own wrapper](#)
- Use [TQ2](#) and it's exponential backoff retry policy

Idempotency concerns

In a scenario where retrying mutations raises idempotency concerns we suggest using available idempotency frameworks.
